P1	Making sketch for the prototype build plan	2026-10-01	AC

WHERE IT GOES
This part in colour, its neighbours in grey

HOW TO MAKE IT AND HOW IT FITS

Make two. Cut 1200 long (the deck width) from 50 x 50 x 3 tube;
square the ends and cap them with 3 mm plate.
Drill 13 mm through both walls, 40 from each end, on the centre line:
these line up with the trailer's two side rails.
Fit: the skids run across the deck, 500 apart (centres), each 100 in
from the ends of the firebox. Weld each to the firebox floor with
50 mm stitch welds every 150, both sides.
Each end is held to the side rail by one M12 bolt through the skid,
the deck and the rail, nyloc nut under the rail.
The skids hold the firebox floor 50 above the deck: an air gap
that keeps the deck cool. Never fill it in.
Check: both skids flat on a level floor; no rock.
